The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) acquired resistance, and (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity against a microorganism that is

                                                                                                                         This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Indolicidin, bactenecin, sulphate-reducing bacteria, growth inhibitor, corrosion, degradation, metal, concrete, cement, dental implant, biofilm.
Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors

                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to a method for inhibiting growth of sulphate-reducing bacteria (A) on a material (B) sensitive to corrosion or degradation, by applying to (B) a bacterium (C) that secretes a compound (1) able to inhibit growth of (A). The method is used to protect metal, concrete or cement against corrosion and degradation, but (B) can also be used to protect dental implants. (B) is present in an open or closed system (e.g. water cooling tower, liquid storage container, fuel tank, sewer or drainage system etc.) or part of a bridge or other structure. The method is more effective and less expensive than known methods for inhibiting (A), and reduces the amount of toxic chemicals released. Conventional biofilms of aerobic organisms tend to encourage growth of (A), and addition of (C) to the biofilm prevents this. A single application of (C) lasts for a long time, and (I) are produced exactly where they are required and inhibit (A) without significant impact on other organisms (this effect includes reducing resistance of (A) to conventional (B) is exactly where they are underlyind material is still protected by chiffusion of (I) from neighbouring areas
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent.

The invention relates to isolated antimicrobial peptides (see AAV67310-Y7347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coli, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit the growth of a eukaryotic cell, especially an also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                 Antimicrobial peptide useful for inhibiting the growth of bacteria and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial peptide useful for inhibiting the growth of bacteria and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC-NH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                           This sequence represents a wild-type bovine bactenecin peptide

                peptides
            derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacterial including both gram positive and negative species including Bacherichia coli, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepais associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protection, endogenous therapeutic peptide, peptidase, conjugation, blood component, modification, succinimidyl, maleimido group, amino, hydroxyl; thiol; hormone, growth factor, neurotransmitter.
AAY67330-Y67347) derived from bactenecin, and includes analogues,
                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                     888888888888888
                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                              ద
```

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.
Modifying and attaching therapeutic peptides to albumin prevents or

computations a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

[I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half infe) and specificity as bonding to large molecules decreases.

The invention usersizes new transprant Compositions competent.

In inferior plantage the compounds of the media is capable of extending the receptor binding compounds. The media is capable of extending the preservation period past 72 hours and can provide organs with increased functionality upon transplant, animals receiving kidneys stored in the control animals creativine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) alone. Lower serum creatinine levels are indicative of healthier kidneys and a more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures such or transplant of healthier corgans leads to a decrease in chronic rejection. This sequence represents an antimicrobial defensin peptide studied in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Media comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds useful for the storage and preservation of organs prior to transplant.
                                                                                                   Transplant, antimicrobial peptide; pore forming agent; cerdioplegia; cell surface receptor binding compound; kidney transplant; cardioplegia; organ transplant; transplant rejection; defensin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes new transplant compositions comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a vaccine comprising at least one antigen and at least one cathelicidin derived antimicrobial peptide or its derivative. The vaccine is useful for active immunization, especially of humans or animals without protection against the specific antigen. The cathelicidin derived antimicrobial peptide is useful in the preparation of an adjuvant for enhancing the immune response to at least one antigen, where the adjuvant enhances the uptake of at least one antigen, where the presenting cells (APC), and the adjuvant is added to the vaccine. The present equence represents a bovine derived linear or cyclised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine for active immunization or for preparing an adjuvant for enhancing an immune response to at least one antigen, comprises at least one antigen and at least one cathelicidin derived antimicrobial peptide.

Bactenecin antibacterial peptide SEQ ID NO:23.

AAU91001 standard; peptide; 12 AA.

AAU91001 ID AAU9 XX

20-AUG-2002 (first entry)

```
The present invention describes an antibacterial compound (I), comprising a conjugates of glycopeptide and peptidic membrane-associating elements.

(I) comprises the formula "L-W-X", where: "V = a glycopeptide moiety that inhibits peptidoglycan blosynthesis in bacteria; I = a linking group; W = conjugates the formula "L-W-X", where: "V = a glycopeptide moiety that inhibits peptidoglycan blosynthesis in bacteria; I = a linking group; W = conjugates the formula "L-W-X", where: "V = a method of treating or preventing a bacterial infection, comprising the administration of (I); and (2) use conjugates in flow the gram of (I); and (2) use conjugates in flow the gram positive and gram negative bacterial infection.

(I) are used in the manufacture of a medicament of the treatment or prevention of animal body, including both the gram positive and gram negative bacteria animal body, including both the gram positive and gram negative bacteria conjugation of staphylococcus sp., Vibrio sp., Neisseria sp., Escherichia sp., Rlebsiella csp., Hemophilus sp., Clostridium sp., Rendomonas sp., Actinomyces sp., Clostridium sp., Peradomonas sp., Actinomyces sp., Pheumococcus sp., Vibrio sp., Neisseria sp., Borrelia sp., Rlebsiella csp., Hemophilus sp., Clostridium sp., Particularly antibiotic resistant as an alternative to, or in conjunction with, antibiotic prophylaxis. (I) exposed in wound tissue; and for prophylactic use in dental treatment as an alternative to, or in conjunction with, antibiotic prophylaxis. (I) has stronger binding to bacterial membranes which have a higher proportion of membranes associated blosynthetic proteins. Vancomycin shows an enhanced antimicrobial activity upon derivatisation with (I) and is effective to treat the antibiotic resistant bacterial community in the community of the present peptides given in the community of the present in the peptides given in the constant in the constant invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibacterial compound, useful for the treatment of a bacterial infection by e.g. gram positive or negative bacteria, comprises a conjugate of glycopeptide and peptidic membrane-associating element.
Antibacterial; glycopeptide; peptidic membrane associating element; bacterial infection; vancomycin; peptidoglycan biosynthesis inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes an antibacterial compounding the present invention describes an antibacterial conjugates of glycopeptide and peptidic membrane-associating lements.

(I) comprises the formula V-L-W-X, where: V = a glycopeptide moiety that inhibites peptidoglycan biosynthesis in bacteria; L = a linking group; W = a peptidic membrane-associating element; and X = H or a membrane-associating element; and X = H or a membrane-associating described: (I) a method of treating or preventing a bacterial infection, comprising the administration of (I); and (2) use of a bacterial infection, comprising the administration of (I); and (2) use of (I) in the manufacture of a medicament for the treatment or prophylaxis of a bacterial infection in a human or animal body, including both the gram positive and gram negative bacteria including Mycobacterium sp., Enterococcus sp., Bornelia sp., Robeiella sp., Bornelia sp., Actinomyces sp., Pseudomonas sp., Actinomyces sp., Pheumococcus sp., Clostridium sp., Pseudomonas sp., Actinomyces sp., Pneumococcus sp. or Salmonalla sp., particularly antibiotic resistant bacterial strains. (I) are also useful as wound treatment agents to prevent adhesion of bacteria to matrix proteins, especially fibronectin, exposed in wound tissue; and for prophylactic use in dental treatment element elemen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibacterial compound, useful for the treatment of a bacterial infection by e.g. gram positive or negative bacteria, comprises a conjugate of glycopeptide and peptidic membrane-associating element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antibacterial compound (I), comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     has stronger binding to bacterial membranes which have a higher proportion of acidic phospholipids than the eukaryotic organishms, also having a higher proportion of membrane associated biosynthetic proteins. Vancomycin shows an enhanced antimicrobial activity upon derivatisation with (I) and is effective to treat the antibiotic resistant bacterial strains. ABB81234 to ABB81272 represent peptides given in the exemplification of the present invention
                                                                                                                                   Antibacterial; glycopeptide; peptidic membrane associating element; bacterial infection; vancomycin; peptidoglycan biosynthesis inhibition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```
The invention comprises a vaccine that contains at least one antigen and a carrier peptide that is able to strongly enhance the immune response to the specific co-administered antigen. The carrier peptides of the invention are able to strongly enhance the immune response to a specific co-administered antigen and therefore constitutes a highly effective antigen. The carrier peptides efficiently TRANSIOad antigenic peptides into antigen presenting cells. The vaccine of the invention is useful for vaccinating a mammal against a specific antigen or group of specific antigens derived from: a virus (e.g. HIV or Epstein-Barr virus); bacteria in fungi; parasites; or antigens form a tumour. The present amino acid sequence represents the bovine linear dodecapeptide which was used as a carrier peptide in an example of the invention
                                                                                                                       Anti-microbial peptide; antigenic peptide TRANSload; infection; tumour; antigen presenting cell; vaccine; carrier peptide; bovine; cow;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel vaccine comprising an antigen and an immunostimulating substance that strongly enhances immune response to the co-administered antigen, and efficiently TRANSloads antigenic peptides into antigen presenting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Targeting ligand; bioactive agent; polymer matrix; cancer; cytostatic; cathepsin-D substrate; peptides; neuroreceptor; adrenal receptor; fibronectin; vitronectin; integrin; RGD motif; angiogenic endothelium; tumour; cationic cancer-targeting peptide.

The invention relates to a composition comprising a bioactive agent homogeneously dispersed in a targeted matrix for use as a delivery vehicle comprising are a targeted matrix for use as a delivery vehicle comprising a polymer associated with a targeting ligand, enhancing the bioavailability of an agent comprising administration of the composition and treating cancer comprising administration of the novel composition. The method is useful for targeted delivery of a drug, especially in cancer therapy. The targeting ligand may be a peptide. Examples of targeting peptides are disclosed including cathepsin-D publides, peptides targeting receptors in the brain and kidney, peptides targeting the RGD (Arg-Gly-Asp)-motif in, e.g., antibodies, peptides targeting the analogenic endothelium of solid tumours, tissue profit and the control of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  adrenal gland and retina), and cationic cancer- targeting peptides. The present sequence is a peptide targeting ligand disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Targeted delivery system comprising a bioactive agent homogeneously dispersed in a targeted matrix is especially useful in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial; purple blotch; gene therapy; antibacterial; fungicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specific peptides (e.g. of lung, skin, pancreas, intestine, uterus, adrenal gland and retina), and cationic cancer- targeting peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 62; DB 6; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                       The invention relates to a polypeptide comprising at least one protease-
resistant or protease-sensitive sequence, bound to the C-terminal side of
the target polypeptide. The polypeptides are useful as antimicrobial
agents against Ceratocystis fimbriats, which causes purple blotch in
sweet potatoes, or Escherichia coli. They are also used in gene therapy.
The present sequence is cow bactenecin peptide used in the
exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antimicrobial; ophthalmic; prostaglandin; hypotensive; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ophthalmic solution useful for the treatment of increased intraocular pressure comprises a prostaglandin of the F-series and an antimicrobial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a novel cosmetic and/or dermo-cosmetic composition (A), which contains an active complex (I), between at least one specific peptide and/or protein (Ia) and at least one constitute peptide and/or protein (Ia) and at least one acetylglucosamine or bactinecine. The present sequence is a preferred (Ia) sequence. (A) imparts to the skin, or its surface, of humans or animals, the ability to act/react, by itself, to alleviate stresses and dysfunctions, by activation of molecular, cellular and/or tissue mechanisms that already exist. The composition is used to ensure a proper equilibrium and incutioning of the skin and provides (or restores) the skin's capacity for adaptation, resistance and protection. A preferred application is a gel for regulating the skin flora.
          prostaglandin of the F-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intraocular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work synergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, ocular cell dysplasia, irridial melanocyte hyperplasia, and hyperpigmentation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of

The invention describes providing cells expressing heterologous keratinocyte growth factor-2 (KGF-2) (I) comprising providing a host cell (II) consisting of primary keratinocytes and immortalized keratinocytes and an expression vector comprising a DNA sequence encoding (I) operably linked to a regulatory sequence; introducing the expression vector to linked to a regulatory sequence; introducing the expression vector to comprising and culturing (II) under conditions such that (I) is expressed. Also described are: (II) produced by the novel method; a composition comprising a keratinocyte specific promoter operably linked to a DNA sequence encoding KGF-2 or an antimicrobial polypeptide; a host cell comprising the vector; a method for providing a skin equivalent expressing comprises the vector; a method for providing a skin equivalent expressing comprises the vector; a method for providing a skin equivalent expressing comprises the vector; a method for providing a skin equivalent expressing comprises an exogenous antimicrobial polypeptide; a composition comprising colls with increased pluripotency or multipotency relative to a population comprising the cells under conditions such that electroporated cells with increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Providing cells expressing heterologous keratinocyte growth factor-2 (I), which is useful to treat wounds e.g. ulcerative colitis, comprises introducing a vector comprising a DNA that encodes (I) to a host cell and culturing the host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pluripotency or multipotency relative to the population of cells are selected; a population of cells generated by the method; a population of cells generated by the method; a method of selecting keratinocytes with holoclone or meroclone cell morphology comprises providing a population of keratinocytes and electroporating the keratinocytes under conditions
                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises polymeric nanoshells consisting of two or more biocompatible polymer layers that define a hollow core, the polymeric nanoshells are between 50-1000 nm in diameter and one or more of the polymer layers contains charged organic polymers. The polymeric nanoshells of the invention are useful for treating cancer. The polymeric agents or drugs to specific itssues. The present anion dealoustic represents or tumor cell targeting peptide that was used in the
        morphology are selected, and a keratinocyte population generated by the method. (1) is useful to treat wounds such as venous ulcers, diabetic ulcers, pressure ulcers, burns, ulcerative colitis, mucousal injuries, internal injuries or external injuries. The method is useful to increase practitioners's success in healing wounds and/or accelerate the rate of fronic wound healing. The NIKS cells is genetically uniform, pathogen antimicrobial peptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bactenedin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAF7330-Y67347) derived from bactenedin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Bacteria coli, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepais associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiprollferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and antigutive species including Escherichia coll, Pseudomonas aeruginosa and salmonalla typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antimicrobial peptide useful for inhibiting the growth of bacteria and as

                                                                                                                                                                                                                                                          The invention relates to a vaccine comprising at least one antigen and at least one cathelicidin derived antimicrobial peptide or its derivative. The vaccine is useful for active immunication, especially of humans or animals without protection against the specific antigen. The cathelicidin derived antimicrobial peptide is useful in the preparation of an adjuvant derived antimicrobial peptide is useful in the preparation of an adjuvant adjuvant enhances the uptake of at least one antigen, where the presenting cells (APC), and the adjuvant is added to the vaccine. Sequences ABB07701-07 represent cathelicicidin proteins form various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Media comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds useful for the storage and preservation of organs prior to transplant.
                                                                                                                                                             Vaccine for active immunization or for preparing an adjuvant for enhancing an immune response to at least one antigen, comprises at least one antigen and at least one cathelicidin derived antimicrobial peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transplant; antimicrobial peptide; pore forming agent; cardioplegia; cell surface receptor binding compound; kidney transplant; cardioplegia; organ transplant; transplant rejection.

antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds. The media is capable of extending the preservation period past 72 hours and can provide organs with increased functionality upon transplant. animals receiving kidneys stored in the media of the present invention for either three or four days had serum creatinine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) alone. Lower serum creatinine levels are indicative of healthier kidneys are in a more preferable prognosis for the transplant patient. The media of the invention are useful for decreasing the incidence and/or severity of delayed graft function in patients receiving transplanted kidneys stored and/or treated in the media. The media may also be used in procedures cond as cardioplegia. It is contemplated that transplant of healthier organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial peptide studied in the development of the transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Providing cells expressing heterologous keratinocyte growth factor-2 (I), which is useful to treat wounds e.g. ulcerative colltis, comprises introducing a vector comprising a DNA that encodes (I) to a host cell and culturing the host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes providing cells expressing heterologous keratinocyte growth factor-2 (KGF-2) (I) comprising providing a host cell (II) consisting of primary keratinocytes and immortalized keratinocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

linked to a regulatory sequence; introducing the expression vector to [11], and culturing (II) under conditions such that (I) is expressed.

Also described are: (II) produced by the novel method; a composition comprising (II) expressing (I); a method of treating wounds; a vector comprising a keratinocyte specific promoter operably linked to a DNA sequence encoding KGF-2 or an antimicrobial polypeptide; a host cell.

Comprising the vector; a method for providing a skin equivalent expressing comprising the vector; a method for providing a skin equivalent expressing an exogenous antimicrobial polypeptide; a composition comprising certainocytes expressing an exogenous antimicrobial polypeptide; a method for providing a human tissue expressing an exogenous KGF-2 and an exogenous antimicrobial polypeptide; a method of selecting cells with increased pluripotency or multipotency relative to a population of comprising providing a population of cells and electroporating the cells under conditions such that electroporated cells with increased pluripotency or multipotency relative to the population of cells generated by the method; a method of selecting expension of cells generated by the method; a method of selecting expension of cells generated by the method; a method of selecting expension of cells generated keratinocytes with holoclone or meroclone cell morphology comprises providing a population of selecting that electroporated keratinocytes under conditions of keratinocytes under conditions and a bearting comprises providing a population of a bearting the cells generated and electroporated cells conditions of method of selecting cells conditions and a bearting conditions or meroclone cell method; a method of selecting cells conditions or meroclone cells conditions conditions and a bearting cells conditions and a bearting cells conditions or meroclone cells c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              morphology are selected, and a keratinocyte population generated by the method. (1) is useful to treat wounds such as venous ulcers, diabetic ulcers, pressure ulcers, burns, ulcerative colitis, mucousal injuries, internal injuries or external injuries. The method is useful to increase practitioners's success in healing wounds and/or accelerate the rate of erronic wound healing. The NIKS cells is genetically uniform, pathogen antimicrobial peptide of the invention.
expression vector comprising a DNA sequence encoding (I) operably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

The invention describes a RNA interference (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described and the antisense sequence targets a human gene sequence. Also described care: a pharmaceutical preparation comprising (I); reducing (I); involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases muclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apob-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or cherwise unwanted expression of apob-100, elevated or cherwise unwanted cortering from a disorder characterised by elevated or cherwise unwanted cortering from a disorder characterised by elevated or cherwise unwanted disorder is chosen from the HDL/DL cholesterol imbalance, dyslipidaemias, coronary artery disease (CAD), coronary heart chisease (CHD) and atherosclerosis. (I) is administered to a subject to cinhibit hepatic glucose production or for treating glucose-metabolism. Cornary heart diseases as mentioned above, cancer (e.g. breast, colon or cor treating glucose-metabolism cald sequence of a cell permeationed bove, cancer (e.g. breast, colon or cor treating glucose-metabolism cortex diseases as mentioned above, cancer (e.g. breast, colon or cor treating glucose-metabolism cortex disease (CBD) and atherosclerosis. (I) is administered to a subject to colon or cortexpine and col

This invention relates to a novel interfering RNA (iRNA) agent comprising Disclosure; SEQ ID NO 19; 252pp; English.

a sense sequence, and an antisense sequence, which targets an RNA expressed in kidney, where the agent has a stabilising modification. The invention may be useful for the production of compounds with a nephrotropic, antidiabetic cytostatic, vasotropic, antidiabetic cytostatic, vasotropic, antidiabetic cytostatic, vasotropic, antidiabetic, cytostatic, vasotropic, antidiamatory, dermatological or immunosuppressive activity through antisense therapy. The invention is useful for treating a subject having or at risk for having a disorder of the kidney such as ureter obstruction, diabetes, proteinurea, renal carcinoma, Fanconi's syndrome and Bartter's syndrome, where the iRNA is administered before, during, or after a kidney transplant. The iRNA may be administered to a subject in shock and is useful for treating renal vascular hypertension, glomerular sclerosis, glomerular nephritis, systemic lupus erythematosus, HIV-associated nephropathy, renal fibrosis, or inflammatory diseases that may be eventually lead to necessary renal transplantation. The present sequence is that of a cell permeation peptide which was used during the illustration of the iRNA agents of the invention.

comprises sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence targets a human gene sequence. The following are disclosed: a pharmaceutical composition comprising (1); and a device for administering (1) into a patient. (1) is useful for reducing apoB-100 levels or glucose-6-phosphatease levels in a subject. (1) targets a sequence identical to any one of sequences as given in the specification. (1) comprises a cholesterol moiety. The cholesterol moiety is coupled to a sense strand. (1) further comprises a second cholesterol moiety. The second cholesterol moiety is coupled to a sense strand. (1) the second cholesterol duplex region of (1) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted

The invention describes an interference RNA (iRNA) agent (I) comprising a

expression of apo-B-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from HDL/LDL cholesterol imbalance, dyslipidaemia (e.g., familial combined hyperlipidaemia or acquired hyperlipidaemia, coronary hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary attery disease, coronary heart disease and atheroscilerosis, preferably statin-resistant hypercholesterolaemia. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxzone-resistant diabetes. (I) has endonuclease or exonuclease resistance. This is the amino acid sequence of a cell permeation peptide that can be attached to iRNA's to enhance cellular recognition and absorption of the iRNA's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neuroprotective; interfering RNA; iRNA; gene silencing; gene regulation; cancer; rheumatoid arthritis; retinal neovascularization; viral infection; viral hemorrhagic fever, neurological disease; respiratory tract infection; poliovirus infection; variola virus infection; ribose replacement modification subunit.

The invention relates to an interfering RNA (iRNA) agent (A1), comprising a first and a second strand, where at least one monomer contains noncribose subunit is incorporated into at least one of the strands or where at least one bull it is incorporated into at least one of the strands or where at least one subunit is derivatized with a lipophilic moiety which chances entrance into a cell. (A1) is useful for silencing a target gene which involves providing (A1) to which a lipophilic moiety is conjugated, to a cell. (A1) is administered to an organism. The cell is a cell of a cell line. (A1) which is conjugated to a lipophilic moiety, is administered to an organism. The cell which is conjugated to a lipophilic moiety, is administered to an organism. Succeed with a cell which is not part of an organism, is administered in the absence of or in a reduced amount of other reagents that facilitate or enhance delivery, preferably the other reagents are absent. (A1) is useful for modulating expression of a target gene in a subject (a11 claimed). (A1) is useful for modulating expression of a target gene in carious cells such as epithelial cell or mesodermal cell, neural cell, etc. (A1) is useful for cancer, observed on the carding engoners or a leukemia cell, etc. (A1) is useful carcinoma, mate breast carcinoma, cervical cancer, basal cell carcinoma, carcinoma, male breast carcinoma, cervical cancer, basal cell carcinoma, colorectal adenocarcinoma, aliver cancer, sophageal squamous cell carcinoma, acute leukemias Eurimos, viral carcinoma, rheumatoid arthritis, retinal neovascularization, viral control cancer; squamous cell carcinoma, acute leukemias Eurimos, viral carcinoma, cellence colorectal denocarcinoma, acute leukemias Eurimos, viral carcinoma, intercanner delicerial carcinoma, cellence colorectal carci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; antimicrobial; virucide; immunosuppressive; antiinflammatory; analgesic; neuroprotective; anticonvulsant; nootropic; gene silencing; RNA interference; cancer; viral infection; bacterial infection; amoeba infection; trialinfection; fungal infection; autoimmune disease; immune disorder; Huntingtons chorea; inflammation; loss of heterozygosity; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               lymphoma, viral hemorrhagic fever or neurological disease, respiratory tract infection, polio and smallpox. The incorporation of ribose replacement modification subunit (RRMS) in (A1) confers new properties such as enhances or modulates one or more existing properties in the RNA. Other moieties may also be attached to the RRMS moiety including ligands and targeting peptides. This sequence corresponds to a targeting peptide which is a cell permeating peptide used to allow the iRNA entry into a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cell permeation peptide #13 for oligo containing protected monomer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel protected monomer (MR1). (MR1) is useful for preparing natural or modified oligoribonuclectides or polymeric molecules and preparing an RNA e.g. an iRNA agent. The iRNA agent (A1) is useful for treating a subject at risk for or afflicted with unwanted cell proliferation e.g. lung cancer, breast cancer, prostate cancer, ovarian cancer, and leukemia, for treating a subject infected with a virus e.g. HIV, hepatitis B virus, and human papilloma virus, or at risk for or afflicted with a disease or disorder associated with viral infection, treating a subject infected with a disease or disorder associated with infection, treating a subject with a disease or autoimmune disease or disorder subject with a disease or autoimmune disease or disorder, ineurodegenerative trinucleotide repeat disorder e.g. Huntington disease and disorder associated with loss of heterozygosity (LOM) e.g. cancer. (A1) has ability to inhibit degradation, e.g. by nucleases. This sequence corresponds to a peptide fragment that can be used as a carrier peptide for oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neuroprotective; nootropic; antiparkinsonian; gene therapy; antisense therapy; expression; pharmaceutical; neurodegenerative disease; antiparkinsonian; neuroprotective; nootropic; bactenectin.
                                                                                                                                                                                                                                                              Novel protected monomers useful for preparing natural or modified oligoribonucleotides and for synthesizing iRNA agent that is useful for treating cancer and microbial infections.

Also described are: treating a human, a pharmaccutical composition comprising the above iRNA agent that targets the alpha-synuclein gene, and a pharmaccutical carrier; reducing the amount of SNCA RNA in a cell of subject; making an iRNA agent; evaluating an iRNA agent that targets an SNCA nucleic acid; and evaluating an agent for the ability to inhibit SNCA expression. The composition and methods are useful for treating neurodegenerative diseases, such as synucleinopathy. Parkinson's disease, Alzheimer's disease, multiple system atrophy or Lewy body dementia. This is the amino acid sequence of a cell wall permeating peptide suitable for use delivering the siRNA's of the invention into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC 1S-NH2.

Bactemedin is an antificrobial cationic peptide, with antificrobial activity. The invention relates to isolated antimicrobial peptides (see AR67330-767347) derived from bactemedin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Bescherichia coli, Pseudomonas aeruginosa and salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepais associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial peptide useful for inhibiting the growth of bacteria and as

ij
activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiprolliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coli, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, anidated variations and conservative variation. The peptides antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and angative species including Bscherichia coll, Pseudomonas aeruginosa and salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial peptide useful for inhibiting the growth of bacteria and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiprollferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coll, pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder

This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAX67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coll. Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock the peptides can
                                                                                                                                                                                                                                                                                                                          Antimicrobial peptide useful for inhibiting the growth of bacteria and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis;

Antimicrobial peptide useful for inhibiting the growth of bacteria and as anticancer agents.
                                                                                                                                                                                                                            antimicrobial peptide mimeric, especially a component such as magainin antimicrobial peptide and/or analogue of magainin antimicrobial peptide present in an amount effective as a preservative in the composition, and includes a therapeutically effective component. Magainin antimicrobial peptides display a reduced eye irritation compared to existing preservatives for ophthalmic compositions. The peptides are highly watersoluble allowing effective antimicrobial action in oil-in-water emulsion. The preserved ophthalmic composition is useful for eye treatment, may be used as a surgical irrigant, and to care for contact lenses. The present sequence represents an antimicrobial defensin peptide of bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bactenecin, antimicrobial activity, cytostatic, antiproliferative, antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC 21-NH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a derivative of the bovine bactenedin peptide. Bactenedin is an antimicrobial dationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenedin, and includes analogues,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ï

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cyrostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and salmonella typhimurium. The peptides can be used to inhibit emdotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryoric cell, especially an animal, neoplastic cell, in particular a gliobhastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial peptide useful for inhibiting the growth of bacteria and as anticancer agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Magainin; antimicrobial; preservative; ophthalmological; eye treatment; contact lens; cecropin; bovine neutrophil peptide; BNP-1; defensin.

                                                                                                                                                                                                                                                                                       ö
derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coll, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) -modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cationic peptide, tumour, pharmaceutical composition, cancer, treatment, leukaemia, polyoxyalkylene-modified, APO, lymphoma, multiple myeloma, breast, lung, ovary, cervix, uterus, skin, prostate, liver, colon,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel pharmaceutical composition containing optionally activated polyoxyalkylene-modified cationic peptides, useful for treating tumors.

Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides detrivity. The invention relates to isolated antimicrobial peptides (see AX67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coli, Pseudomonas aeruginosa and Salmonalla typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryottic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial peptide useful for inhibiting the growth of bacteria and as anticancer agents.
                                                                                                                                                             Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC 2A-NH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention relates to a method of identifying a polynucleotide or pattern of polynucleotides regulated by one or more sepsis or inflammatory inducing agents and inhibited by a cationic peptide, which comprises contacting the polynucleotide or polynucleotides with one or more sepsis or inflammatory inducing agents, contacting the polynucleotide or polynucleotides with a cationic peptide either simultaneously or immediately thereafter and determining a change in expression. The method is useful for identifying a polynucleotide or pattern of polynucleotides regulated by one or more sepsis or inflammatory inducing agents and inhibited by a cationic peptide for preparing a composition for blocking sepsis or inflammation or for enhancing innate immunity. The present sequence is a cationic peptide shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          indolicidin analogue; antiseborrheic; dermatological; antiinflammatory; antiarthritic; immunosuppressive; vulnerary; antipruritic; antimicrobial; antipruritic; neuroprotective; antipsoriatic; inflammation; acne; arthritis; autoimmune disease; burn; Crohn's; colitis; contact hypersensitivity; delayed; eczema; endotoxin shock syndrome; fibromyositis; graft rejection; microbial infection; multiple sclerosis; parapsoriasis; psoriasis; sclerosis; seborrhea.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention described as composition comprising and a solvent (III). Also described is a composition comprising (I), buffer a solvent (III). Also described is a composition comprising (I), buffer (IV) and (III). (I) has antibadererial, virucide, antibilammatory, fungicide, protozoacide, parasiticide, vulnerary, dermatological, herbicide and insecticide activities. (A) can be used to reduce the herbicide and insecticide activities. (A) can be used to reduce the sopulation of microflora (eukaryotes, prokaryotes or viruses) at a target site, particularly for treatment or prevention of infections. They can be used to treat a wide range of systemic infections (e.g. sepsis) and for used to treat a wide range of systemic infections. They can be used to treat the devices have been, or will be, inserted into the body (alternatively, they are used to treat the devices); and (ii) at sites on the skin (particularly for treating acne) or the mucosa. The devices the skin (particularly central venous, vascular dialysis, pulmonary artery, peritoneal dialysis or umblical catheters. They may also be used as surface disinfectants; for treatment of clothing and air filters; in commetties and soaps; as herbicides and insecticides; in building materials (e.g. silicone sealants) and in processing animal products, e.g. hides. The present sequence represents an antimicrobial cationic peptide, which is used in the exemplification of the present invention.

The specification describes a method for stimulating innate immunity. The method comprises administering a cationic peptide. The innate immunity is evidenced by host immune cell activation, prolliferation, differentiation or mitogen activated protein (MAP) kinase pathway activation. The method is used for stimulating innate immunity, for protecting against bacterial infection and regulating sepsis and inflammatory responses. The method provides synergistic therapy. The present sequence represents the bovine wariant of bactenecin, Bac2A, a cationic peptide that is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antimicrobial peptide useful for inhibiting the growth of bacteria and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel indolicidin analogue. The analogue of the invention demonstrates antiseborrheic, dermatological, antiinflammatory, antiarthritic, immunosuppressive, vulnerary, antipruritic, antimicrobial, antipruritic, neuroprotective and antipportatic and may be useful for treating or preventing inflammation at a target site. The inflammation at the target site may be associated with a condition selected from acne, arthritis, autoimmune disease, burn, crohn's disease, colitis, contact hypersensitivity, delayed hypersensitivity, eczema, endotoxin shock syndrome, fibromyositis, graft rejection, microbial infection, multiple sclerosis, parapsoriasis, parapsoriasis, psoriasis, sclerosis and seborrhea. The current sequence is that of the synthetic indolicidin analogue peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunostimulant; immunosuppressive; antiinflammatory; innate immunity; cationic peptide; bacterial infection; sepsis; antibacterial; infection; immune stimulation; inflammation; synergistic therapy; bactenecin; Bac2A.

         AN67330-y67347) derived from bactenedin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiprollerative, antiviral, and antifungal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Escherichia coll, Pseudomonas aeruginosa and Salmonella typhimurium. The peptides can be used to inhibit endocoxaemia of sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC 2S-NH2.

The present invention describes an antibacterial compound (1), comprising a conjugates of glycopeptide and peptidic membrane-associating elements.

(1) comprises the formula v-L-W-X, where: V = a glycopeptide moiety that inhibits peptidoglycan biosynthesis in bacteria; L = a linking group; W = a peptidic membrane-associating element; and X = H or a membrane-conformative element. Also described: (1) a method of treating or preventing a bacterial infection, comprising the administration of (1); and (2) use of a bacterial infection. (1) are used in the manufacture of a medicament for the treatment or prevention of a pacterial infection. (1) are used in the manufacture of a medicament of for the treatment or prophylaxis of a bacterial infection in a human or animal body, including both the gram positive and gram negative bacteria animal body, including both the gram positive and gram negative bacteria contains Mycobacterium sp., Enterococcus sp., Escherichia sp., Klebsiella csp., Hemophilus sp., Vibrio sp., Neisseria sp., Borrelia sp., Actinomyces sp., Staphylococcus sp., Clostridium sp., Pseudomonas sp., Actinomyces sp., Pheumococcus sp., Clostridium sp., particularly antibiotic resistant conferential strains. (1) are also useful as wound treatment agents to provent adhesion of bacterial of metrix proteins, especially fibronectin, exposed in wound tissue; and for prophylactic use in dental treatment as an alternative to, or in conjunction which match or prophylaxis. (1) has stronger binding to bacterial membranes which have a higher proportion of acidic phospholipids than the eukaryotic organisms, also having a higher proportion of membranes which have a higher proportion of membranes associated biosynthetic proteins. Wancomycin shows an enhanced antimicrobial activity upon derivatisation with (1) and is effective to treat the antibiotic resistant bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibacterial compound, useful for the treatment of a bacterial infection by e.g. gram positive or negative bacteria, comprises a conjugate of glycopeptide and peptidic membrane-associating element.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibacterial; glycopeptide; peptidic membrane associating element; bacterial infection; vancomycin; peptidoglycan biosynthesis inhibition;
                                                                                                                                                                                                                                                                                                                                                                            Bac2S antibacterial peptide SEQ ID NO:25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (UYCA-) UNIV CAMBRIDGE TECH SERVICES LTD.

                                                                                                                                                                                                                               This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides antifurial and antifurial and antifurial and antifurial and antifurial and antifurial and activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a enkaryoric cell, especially an animal, neoplastic cell, in particular a gliobhastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an isolated or recombinant polypeptide (1) comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in the specification, or a conservative variant; (b) encoded by 1 of 30 sequences (S2), as given in the specification, or a conservative variant; (c) encoded by a sequence that hybridises under stringent conditions to S2; and (d) encoded by a sequence 70 % identical to S2. The expression or activity of (I) is modulated to modulate a plant growth trait in a flowering plant, of the family Brassicacae, preferably in a plant that is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum, Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solanum, Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus, Plnus, or Quercus. A new method is used to detect genes for a plant growth trait. This is the amino acid sequence of plant growth associated
                                                                                                                                                                                                                                                                                                                                                                                     New isolated or recombinant polypeptide for use in modulating a plant growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bactenecin; antimicrobial activity; cytostatic; antiproliferative; antiviral; antifungal; bacterial growth inhibitor; endotoxaemia; sepsis; cell proliferative disorder; anticancer agent; BAC P 2R-NH2.

This sequence represents a derivative of the bovine bactenecin peptide.

Bactenecin is an antimicrobial cationic peptide, with antimicrobial
activity. The invention relates to isolated antimicrobial peptides (see
AAY67330-Y67347) derived from bactenecin, and includes analogues,
chave antimicrobial, cytostatic, antiproliferative, antiviral, and
antifungal activities. The antimicrobial peptides are useful for
inhibiting the growth of bacteria including both gram positive and
inhibiting the growth of bacterial including both gram positive and
salmonella typhimurium. The peptides can be used to inhibit endotoxaemia
or sepsis associated disorders, such as septic shock. The peptides can
also be used to inhibit the growth of a eukaryotic cell, especially an
animal, neoplastic cell, in particular a gliobhastoma cell. The peptides
can also be used to inhibit a cell proliferation-associated disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial peptide useful for inhibiting the growth of bacteria and anticancer agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungalcide; opthalmological; neuroprotective; antibacterial; virucide; fungalcide; opthalmological; neoplasm; cardiac arrest; cerebrovascular disorder; cerebral ischemia; angiogenesis; nervous system disorder; Alzheimer's disease; corneal infection; wound healing; epithalial cell proliferation; skin aging; sunburn; transplantation; chemotaxis; food additive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADM19746;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 52
```

ò 유 used in preventing, treating or ameliorating a medical condition.

Claim 11; SEQ ID NO 553; 809pp; English

The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 95% identical to a channel/transporter protein or sequences at least 95% identical to a chase. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, abbits, goats, horses, cats, dogs, chickens or sheep. They are also used to display a pathological condition or susceptibility to a condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic manuscasays e.g. radioimmunosasays or enzyme linked include autoimmune (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. created include autoimmune coplamms of the breast or liver, cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. created infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial call proliferation, to preven skin aging due to surburn, to maintain tissues to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease architecture.

Claim 1; Page 36; 52pp; English

Isolated nucleic acid molecule encoding a channel/transporter protein is

Ruben SM;

Rosen CA, Barash SC, WPI; 2001-476159/51. N-PSDB; ADM19267 ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention

                 Bactemedin is an antiflate delication of peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAK6730-Y67347) derived from bactemedin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides have antimicrobial, cytostatic, antiproliferative, antiviral, and antifugal activities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and negative species including Bescherichia coli, Pseudomonas aeruginosa and salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders, such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder
This sequence represents a derivative of the bovine bactenecin peptide.

This sequence represents a derivative of the bovine bactenecin peptide. Bactenecin is an antimicrobial cationic peptide, with antimicrobial activity. The invention relates to isolated antimicrobial peptides (see AAY67330-Y67347) derived from bactenecin, and includes analogues, derivatives, amidated variations and conservative variation. The peptides antimicrobial, cyrostatic, antiprollferative, antiviral, and antificing and cartivities. The antimicrobial peptides are useful for inhibiting the growth of bacteria including both gram positive and inhibiting appecies including Bacherichia coll, Pseudomonas aeruginosa and salmonella typhimurium. The peptides can be used to inhibit endotoxaemia or sepsis associated disorders such as septic shock. The peptides can also be used to inhibit the growth of a eukaryotic cell, especially an animal, neoplastic cell, in particular a glioblastoma cell. The peptides can also be used to inhibit a cell proliferation-associated disorder Antimicrobial peptide useful for inhibiting the growth of bacteria and as Gaps 7; 62.1%; Score 38.5; DB 3; Length 13; 76.9%; Pred. New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.

Claim 1; SEQ ID NO 6925; 89pp; English

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or

The invention describes a new isolated nucleic acid molecule comprising a sequence having at least 95% identity with a sequence comprising: (a) a polynuclectide (PN) fragment of a sequence comprising 420-3435 bp, or its allelic variant; (b) a PN fragment of the CDNA sequence; (c) a PN sequence encoding a polypeptide, or its fragment, domain, epitope or species homologue; or (d) a PN that hybridises under stringent conditions to any one of the sequences of (A)-(C). The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as hepatitis or neural disorders such as an acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; secreted polypeptide; autoimmune disease; rheumatoid arthritis; hyperproliferative disorder; neoplasm; breast; liver; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; cerebral ischaemia; nervous system disorder; Alzheimer's disease; bacterial infection; viral infection; fungal infection; coular disorder; skin aging; sunburn; organ transplantation; lissue regeneration; chemotaxis; food additive; food preservative; fat content; vitamin;

                                                                                                                                                                                                                                                                                                                                  e.g. radioimmunoassays or enzyme linked immunosorbent assays
e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA).

Disorders which are diagnosed or treated include autoimmune diseases

(e.g. radioimmunoassays or enzyme linked include autoimmune diseases

(e.g. radioidmunotassays or created include autoimmune diseases

of the breast or liver), cardiovascular disorders (e.g. cardiac arrest),

cerebrovascular disorders (e.g. cerebral ischaemia), nervous system

disorders (e.g. Alzheimer's disease), infections caused by bacteria,

viruses and fungi and ocular disorders (e.g. corneal infection). The

polypeptides can also be used to aid wound healing and epithelial cell

proliferation, to prevent skin aging due to sunburn, to maintain organs

before transplantation, for supporting call culture of primary tissues,

to regenerate tissues and in chemotaxis. The polypeptides can also be

used as food additives or preservatives to increase or decrease storage

capabilities and fat content, as vitamins, as minerals and as other

nutritional components. This sequence represents a human secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, secreted protein, fusion protein, gene therapy, protein therapy, diagnosis, tissue, cancer, tumour, neurodegenerative disorder, leukaemia, developmental abnormality; foetal deficiency; blood, allergy, renal; immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; ischaemic shock; Alzheimer's disease; restenosis; AIDS; osteoporosis; arthritis; testis; lung; thyroid; thyroid; disestin; estion; endocrine; metabolism; regulation; malabsorption; gastritis; neoplasm.
                                                                                                                                                                     New nucleic acid molecule encoding one of 125 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.
                                                                                                                                                                                                                                                                            secreted proteins. The polynucleotides and polypeptides are used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the polypeptides can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays
                                                                                                                                                                                                                                                                 The invention relates to isolated nucleic acid molecules encoding human

```
This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX84924) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 125 novel genes and their fragments (nucleic acid sequences: AAX84933-X85057; amino acid sequences AAX7567-Y27933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the expressed in (see AAX84933 for described uses)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; secreted protein; immune disorder; haematopoietic disorder; hyperproliferative disorder; infectious disease; inflammatory disorder; HIV; anaemia; thrombocytopenia; bleeding; stroke; myocardial infarction; Addison's disease; rheumatoid arthritis; dermatitis; Grave's disease; multiple sclerosis; glomerulonephritis; diabetes; graft-versus-host disease; inflammatory bowel disease; cancer;

diagnosing, preventing, prognosing or treating diseases or disorders associated with aberrant expression and/or activity of the secreted proteins, such as immune disorders, haematopoietic disorders.

Droteins, such as immune disorders, haematopoietic disorders in preticular, the diseases or inflammatory disorders. In particular, the diseases or disorders are HIV, anaemia, thrombocytopenia, bleeding, stroke, myocardial infarction, Addison's disease, rheumatory bowel disease, cancer, bacterial infections, viral infections, parasitic infections, osteoporosis, wounds, atherosclerosis, also be used as food additives or preservatives, or for modulating are brommanial infections, proposition of disease, remaining and additives or preservatives, or for modulating are brommental or physical characteristics. The nucleic acids are also used in chromosome mapping, in forensic biology or as molecular weight markers. This sequence represents a human secreted protein of the
New secreted nucleic acid for diagnosing, preventing or treating diseases associated with aberrant expression or activity of the polypeptide it encodes, e.g. cancer, human immunodeficiency virus, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention also relates to human secreted proteins and the nucleic

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypercosis and osteomyellis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies contacting the amount of bound protein in the sample. The colypeptides may be used as antigens in the production of antibodies contacting the amount of bound activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by canzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

conciding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; taking in membral perspected of the invention; and the invention; and immuno immuno immuno proteins. Totall population of the invention; and immuno immuno proteins. Totall populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient; The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymetride are useful for diagnosing, preventing cells that express the protein. The polymulations or antigen-presenting cells that express the protein. The polymulations or antigen-presenting cells that express the protein. The polymulations and also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the sequence represents a polymetide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the grimming frame) contained within the P. acnes polymucleotides of the canding frame) contained within the P. acnes polymucleotides of the printed specification, but was obtained in electronic format directly the print with the contained within the plant of the printed specification, but was obtained in electronic format directly the print with the polymore of the printed specification, but and the contained within the P. acnes polymore of the printed presents and the printed specification, the printed present and the present and the prese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a carnes. The disorders include SAPHO syndrome (synovitis, are, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of an determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used diagnostic agents for determining P. acnes presence, for example, by chis patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polymucicolide (Archafasta) and to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention also relates to polypeptides encoded by the polymucleotides and host cells comprising a additionally encompasses expression vectors and host cells comprising a colymucleotide of the invention, antibodise against polypeptides of the invention; tusion proteins comprising a polypeptide of the invention; and an isolated T cell population comprising T cells prepared polymetleotides, a vaccine composition (comprising P. acnes polypeptides, polymetleotides, antibodies, fusion proteins; T cell populations, a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymetleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymetides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymentides of the canding frame) contained within the P. acnes polymentides of the canding frame) contained within the P. acnes polymentides of the cinvention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly compared by the presence of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Maisonneuve JL;
Jones R, Carter D;

The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence acceptance or diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene precursor and a method of isolating a diterpene or diterpene precursor and a method of isolating a diterpene synthase comprising growing several cells in the presence of a comprising growing several cells in the presence of a cyast expression library, and the expression of the cells further comprises at least one isolated and purified nucleic conditions where the expression is induced, filtering the cell/resin conditions where the expression is induced, filtering the cell/resin conditions where the expression is induced, filtering the cell/resin conditions where the cell/resin mixture with alcohol to produce an organic eluent and analysing the organic eluent by a screening method including chromatography and/or spectroscopy, to identify the nucleic acid sequence encoding the diterpene synthase. The unicellular contains an induced increases the contains and analysing the organic eluent and analysing the organic eluent procure or diterpene precursor producing contains an is useful as a diterpene or diterpene precursor producing contains and an expression of the contains the diterpene contains an encoding the diterpene contains and an expression of the contains 
                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents a gerantlgeranyl pyrophosphate synthase polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Geranylgeranyl pyrophosphate synthase; diterpene; diterpene precursor; diterpene synthase; defence toxin; volatile defensive signal; pollinator attractant; photoprotectant; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New unicellular organisms comprising exogenous nucleic acids encoding geranylgeranyl pyrophosphate and a diterpene synthase, useful for producing diterpenes and diterpene precursors.

or diterpone precursor comparising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene precursor and a method of isolating a diterpene or diterpene precursor and a method of isolating a diterpene synthase comprising growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified nucleic acid sequence of a yeast expression library, and the expression of the nucleic acid sequence of a gest expression library, and the expression of the nucleic acid sequence is regulated by an inducible promoter under conditions where the expression is induced, filtering the cell/resin mixture, with alcohol to produce an organic eluent and analysing the organic eluent by a screening method including chromatography and/or spectroscopy, to identify the nucleic acid sequence encoding the diterpene synthase. The unicellular microorganism is useful as a diterpene synthase. The unicellular system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents a geranylgaranyl pyrophosphate synthase polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to a unicellular organism for producing a diterpene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New unicellular organisms comprising exogenous nucleic acids encoding a geranylgeranyl pyrophosphate and a diterpene synthase, useful for producing diterpenes and diterpene precursors.
                                                                                                                                                                                                                                                                                                                                                                                                                  diterpene precursor;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAHD syndrome (syndovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory issues associated with acne vulgaries. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies contacting the amount of bound protein in the sample. The commerce proteins proteins in the production of antibodies contactivity of P. acnes proteins. The acnes productions and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by any enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formet directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polymuclectide (ACF64435-ACF64733)

cenceding a Propionibacterium acnes protein. The invention also relates to polymeptides encoded by the polymuclectides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a rivention; tusing no proteins comprising a polypeptide of the invention; antibodies against polypeptides of the invention; tusing an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared to polymucleotides, avaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymetides are useful for diagnosing, preventing cells that express the polymetides are useful for diagnosing, preventing cells that express the polymetides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein, The polymucleotides can also be used as probes or primers for mucleic acid hybridisation. The vaccine composition is useful for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial drugs, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84336 represent P. aeruginosa polypeptides of the invention. Note: The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide,

                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The present invention relates to toluene degrading enzyme genes and proteins tuth (ase AAP23629 and AAB59831), tutI (AAF23630 and AAB59832), tutI (AAF23631 and AAB59834). The tuter (AAF23632 and AAB59834). The toluene degrading enzymes are homologues of pyruvate formate lyase, toluene degrading enzymes are useful for biological treatment of organic compounds and in particular for the degradation of toluene and its analogs contained in liquid or solid waste source. The present sequence is a protein sequence encoded by toluene degrading enzyme gene, TutD/E. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition comprising toluene degrading enzyme useful for biological treatment of organic compounds, especially for degrading toluene or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptomyces platensis subspecies rosaceus dorrigocin ORF7 protein.

The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaceus DORR ORR7 protein
                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated or purified polypeptide involved in biosynthesis of polyketide dorrigocin or polyketide lactimidomycin, useful for preparing dorrigocin or lactimidomycin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to genetic disorders. The present amino acid sequence was used in the exemplification of the invention.

New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.

The invention relates to polynucleotides encoding novel human proteins or their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the abserrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     contraceptive, treating offecoporosis and osteoarthritis, anaemia, Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, coroer, allergy, asthma, graftversus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection. The invention relates to polynuclectides encoding novel human proteins or their active domains. The polypeptides, polynuclectides and antibodies can asked against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the abberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food suppliements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides of polymential proteins, and in generating and in genes mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Colypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proposition and survival of stem cells, as a great continuous and survival of stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               contraceptive, treating osteoporosis and osteoarthritis, anamia, Alzheimer's, Parkinson's and Huntington's diseases, amylotrophic lateral sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, graft-versus-host disease, eczema, haemophilia, thrombosis, anti-inflammatory diseases, nervous system disorders, and infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                The invention relates to new isolated polynucleotides and polypeptides. The sequences, compositions and methods of the invention are useful for diagnosing, preventing or treating diseases involving aberrant protein expression or biological activity, such as coagulation disorders (e.g. haemophilia), wounds, stroke, thrombosis, myocardial infarction, cancer, bone fractures, Alzheinmer's disease, Parkinson's disease and autoimmune disorders. The polynucleotides may be used as hybridisation probes, as oligomers or primers, for polymerase chain reaction, for chromosome and gene mapping, in the recombinant production of proteins and in generation of antisense DNA or RNA. The polypeptides may be used in generating antibodies, as molecular weight markers or as food supplements. This sequence represents a human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                  New polynucleotides and polypeptides useful for diagnosing, preventing or treating diseases involving aberrant protein expression or activity, e.g. hemophilia, wounds, stroke, thrombosis, cancer or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyellis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a ample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies colorising the amount of bound protein in the sample to achieve the specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was
